✓ Manned space stations (Orbitayemye kosmicheskiye stantsii), Moscow, Voenizdat  
N-va obor. SSSR, 1964, 188 p. illus., biblio. 27,000 copies printed. Series  
note: Nauchno-populyarnaya biblioteka

45  
B+1

TOPIC TAGS: space station, secondary power source, artificial gravity,  
radio communication

PURPOSE AND COVERAGE: The successes of modern astronautics permit us today to raise the curtain of the future and get a glimpse into the future of science and technology. This book tells of the problems that must be solved in the next stage of mastering space—the creation of manned space stations in orbits around the earth. Such stations will permit extensive research on the space near the earth and geophysical and astronomical observations and many other types of scientific experiments. Orbiting stations will be the starting platforms for launching space ships to other planets. On the basis of a study and critical analysis of materials published in the Soviet and foreign press, the authors tell of the difficulties to be surmounted by scientists and engineers in the creation of space stations. The reader will find a description of some planned

TITLE: An ultrasonic defectoscope. Class 42, No. 175301 [announced by Scientific Research Institute of Machine Construction (Nauchno-issledovatel'skiy institut tekhnologii mashinostroyeniya)]	
SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 19, 1965, 96	
TOPIC TAGS: defectoscope, defect indicator, error minimization, ultrasonic equipment, ultrasonic inspection, ultrasonic sensor	
ABSTRACT: This Author Certificate presents an ultrasonic defectoscope for inspecting items by the shadow method. The defectoscope contains an ultrasonic oscillator and also an oscillation transmitter and receiver, both mounted on the item being inspected. The device is designed to eliminate the error caused by fluctuations of the signal amplitude of the receiver under the influence of changing dimensions of the item made of material with a large ultrasonic absorption coefficient. A modulator is included in the receiver circuit, and the output voltage of this modulator is used for feeding the feedback voltage to the oscillator. The modulator output voltage possesses a fairly high inertia for preventing a change of the oscillator signal level under the action of sharp, brief signal changes caused by the defects. An auxiliary receiver which is used for the voltage control of the oscillator may be mounted on the surface of the

Budapest, Orvosi Hetilap, Vol 107, No 28, 10 Jul 1966, pp 1297-1300.

Abstract: The authors describe 237 cases of children suffering from rheumatic fever and carditis, respectively. All were afflicted for less than 30 days before treatment commenced, and all showed signs of the disease for the first time. The effects of therapy employing prednisolone + amidazophene and amidazophene alone were discussed with respect to total recovery and any cardiac changes that developed. The criteria for the classification of the cases were described and it was recommended that the treatment involving prednisolone be employed in all cases where there is a suspicion of carditis. 65 references, including 9 Hungarian, 1 Russian, 1 German, and 54 Western.

TITLE: Investigation of the Migration of the Electrode Material in a  
Ratio Tube With an Oxide - Coated Cathode

PERIODICAL: Izvestiya Akademii nauk Uzbekskoy SSR, Seriya fiziko-  
matematicheskikh nauk, 1960, No. 6, pp. 53 - 62

TEXT: The authors investigate migration phenomena in the double triode  
6НЗП (6NZP) with a bantam construction. The parts of the investigated  
bantam radio tube were radiated with thermal neutrons, in a nuclear reactor  
and thereby they were made radioactive. About 50-60 days after the  
radiation when short-life isotopes ( $Au^{198}$ ,  $Mg^{28}$  and others) were decayed,  
such a radioactive structural element was installed in the tube 6 NZP.  
Then the activity generated by this element in other parts of the tube was  
measured. The results of the measurements have only a qualitative  
character. It was stated : The material of the core of the heater, in the  
case in question it was tungsten, migrated to most of the elements of the  
tube : on the cathode, net, anode, mica insulators, etc. The material of

With an Oxide - Coated Cathode

the core of the cathode - nickel - comes on the net and the anode by vaporization through the pores of the oxide - coating. The material of the net (nickel and tungsten) vaporized onto the cathode, anode, insulators, shield grid. The materials of the oxide - coating ( $Ba^{133}$  and  $C^{14}$ ) appeared on the anodes, shield grid and on the inner surfaces of the mica insulators. The observed migration phenomena are essential for the investigation of the work of the oxide cathode since because of the porosity of the oxide coating the migrating elements penetrate in the depth and influence the emission properties of the cathode. ✓

1307. **Benign neurogenic gastric tumours (Russian text)** KAMARDIN L. N.  
Vestn. Khir. 1958, 80/4 (21-27) Tables 1 Illus. 2

Neurinomata of the stomach were found to be present in about 1/4 of all benign non-epithelial gastric tumours. They are more often encountered among women after 50 yr. of age. The clinical course may present the following 3 varieties: (1) without any clinical manifestations; (2) with impairment of the function of the gastrointestinal tract; (3) with mainly complicating symptoms. Roentgen investigation alone has a paramount diagnostic value in diagnosis. Treatment has to be surgical. In a neuroma protruding into the gastric lumen a circular resection of the growth is indicated. In a neurinoma invading the gastric wall, local removal of the tumour with the adjacent gastric wall may be resorted to. When malignancy is suspected, a more radical gastric resection is indicated. The follow-up from 1 to 18 yr. gave encouraging results.

ORG: Metallurgical Institute (Dnepropetrovskiy metallurgicheskii institut)

TITLE: Material balance of titanium in electrical melting of stainless steel

SOURCE: IVUZ. Chernaya metallurgiya, no. 6, 1966, 80-87

16

TOPIC TAGS: metal melting, stainless steel, titanium

ABSTRACT: Under existing technology of alloying stainless steel with titanium.

the amount of titanium taken up by the steel usually varies within the limits 35-70%, and averages approximately 50%. To verify and refine the sources of titanium losses in the alloying of stainless steel, and also to arrive at a precise quantitative evaluation of such losses in the over-all losses of titanium, material balances of two industrial melts of the steel Kh18Ni9T were made.

13

The expended materials, slag, and metal following pouring were weighed. Samples of metal and slag were selected for analysis during the course of melting and pouring. The silicon and aluminum content in the metal were determined by spectral analysis, that of titanium -- colorimetrically, oxygen -- by vacuum melting, nitrogen -- by dissolution and distillation.

Card 1/2 Judging from the fraction of participation of air oxygen in the oxidation of

0925

0639

L 09114-67

ACC NR: AP7002347

titanium, it can be assumed that this source is the chief reason for its instable assimilation. Substantial variations in the assimilation of titanium are evidently a consequence of the different degree of oxidative action of air oxygen as a function of technological factors (physical and chemical properties, the amount of slag, temperature, duration of melt retention after introduction of titanium, etc.)

Sizable sources of the titanium losses are also its oxidation and absorption by the surface layer of the hearth and inclined sides of the furnace, and the oxidation of ferric oxide, manganese, and chromium oxide which enter the slag from the furnace lining. The overall fraction of these losses in the overall titanium loss is 15.9% and 17.8%, and the proportion of losses of titanium resulting from the formation and removal of nitrides from the slag -- 10.2 and 12.1%.

Therefore, to increase the level and stability of assimilation of titanium by the metal being alloyed, it is necessary to decrease or eliminate the oxidative effect of air oxygen in alloying as well as hermetization of the furnace and creation therein of a neutral or reducing atmosphere for the length of time the metal is being alloyed with titanium. Reduction of oxidation of titanium by silicon, oxides of manganese, chromium, and iron is achieved through careful mixing of the reducing slag before adding the titanium alloys.

This work was carried out under the direction of Professor S. I. Khitrika. G. L. Yelinson, I. V. Yefimov, A. V. Gubenko and Ye. V. Lubyanchenko participated in the making of the melts. Orig. art. has: 1 figure, 8 formulas and 5 tables. (JPRS: 37,758)

SOV/133-60-2-9/25

AUTHOR: Kamardin, V. A. (Engineer)

TITLE: Experience in Operating 40-Ton Arc Furnace With High Secondary Voltage

PERIODICAL: Stal', 1960, Nr 2, pp 128-129 (USSR)

ABSTRACT: The author refutes the conclusions of D. F. Gladkiy, V. F. Ivan'ko, and V. V. Kurganov, as well as S. A. Morgulev, on the above subject as discussed in Stal', 1959, Nr 1. By way of comparison, an electric furnace with coupled transformers was converted into a 40-ton furnace and operated under the same conditions as other arc furnaces in the shop. In 1958 a study of the results of the work of units with similar transformers but different secondary voltage during the melting period showed the adverse effect of high voltage (420 and 336 v) on lining, productivity, and technological possibilities of the units. This was corroborated by the German practice of working

Card 1/2

Experience in Operating 40-Ton Arc  
Furnace With High Secondary Voltage

77609  
SOV/133-60-2-9/25

with high secondary voltage. In referring to the operation of large capacity furnaces with high voltage in the U.S. the author emphasizes that D. F. Gladkiy and S. A. Morgulev failed to consider specific features of U.S. furnaces (light charge, high voltage used for 10 to 15 min only, absence of electric furnaces with rotary bodies, etc.). In conclusion the author states: (1) The introduction of coupled transformers is inexpedient since only 85% of the total capacity is used and is, therefore, recommended only as a temporary measure; (2) to prolong lining life and improve productivity in medium-size and large electric arc furnaces it is advisable to increase the transformer power by increasing the secondary current instead of the voltage; (3) minimum decomposition of electrodes is suggested in conformity with the location of holder heads and durability of the roof center. The ratio of the electrode decomposition diameter to melting space diameter should not exceed 0.30. There is 1 tab ; and 6 references, 5 Soviet and 1 German.

TITLE: A study of interfacial esterification of polyvinyl alcohol

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 12, 1965, 2156-2159

TOPIC TAGS: esterification, polyvinyl alcohol, polymer, ~~polymerization degree~~, reaction mechanism, ~~alkali~~

ABSTRACT: The interphase esterification of polyvinyl alcohol with benzoyl chloride was studied. The effects of different organic solvents and different concentrations of benzoyl chloride on the degree of esterification were determined. The esterification was carried out by adding NaOH and benzoyl chloride (dissolved in an organic solvent) to an aqueous solution of polyvinyl alcohol, and by rapid stirring of the resultant mixture. The experimental results are presented in tables and graphs (see Fig. 1). It was found that substitution of KOH for NaOH had a negligible effect on the degree of esterification. The degree of esterification increased with the solubility of the polyvinyl benzoate in the organic solvent and with increase of the alkali concentration in the aqueous phase, but it was independent of the temperature and the duration of reaction. The experimental results are interpreted
